

# WHY CHOOSE RTF FESCUE?

## RTF Fescue grass is a self-repairing lawn grass

**Exclusive to Lawn Solutions Australia, RTF – or Rhizomatous Tall Fescue grass – is a self-repairing grass that produces a thick, even, soft lawn and thrives in cold climate regions.**

**RTF Fescue** also features a leaf texture distinct from normal tall fescue varieties, being much softer to touch, gentle even on bare feet.

A rhizome is a horizontal plant stem most often found underground, which are valued because they send out new roots and shoots, allowing new plants to propagate at a distance from the original plant. More than 10 years ago, turf scientists from the Barenbrug Research Program developed **RTF Fescue** grass as a superior tall fescue variety with rhizome - rich plants, whose rhizome roots fill in bare spots in a thinning lawn.

**Beware** of companies who try to imitate Barenbrug's grasses. University and independent testing has proven that Barenbrug's is a cut above the competition, being the one grasses to exhibit significant rhizomes and rhizomatous activity.

Tall fescue grass is more drought tolerant than most other species due to its deep roots. **RTF Fescue** is one of the deepest rooting cool season grasses available, with roots that travel down to 2m to search for water.

**RTF Fescues** significant rhizomes and rhizomatous activity helps lawn recover from bare spots/damage created by active pets, saving the hassle of repatching.

## Here are some reasons why RTF Fescue is a great choice

- ▶ **Australia's number one tall fescue grass**
- ▶ **Self-repairing grass that fills bare spots**
- ▶ **Medium coarse, deep green in colour**
- ▶ **A strong, deep root base to help withstand drought periods**
- ▶ **Excellent cold weather tolerance**
- ▶ **Good resistance to wear**
- ▶ **Resistance to pets**
- ▶ **Soft to touch and gentle on bare feet**
- ▶ **Grows in sun or shade areas**
- ▶ **Comes with a 10 Year Product Warranty**
