DEAR CUSTOMER

Today we have applied a Pre-Emergent Treatment to your lawn as part of your program. A pre-emergent aims to kill most seasonal grasses before they appear and is applied at the start of the season. Each application can control germinating weed seedlings for up to 10 weeks post-application (pending temperature, rainfall and soil type). Please see below instructions and information on the product.

HOW DOES A PRE-EMERGENT TREATMENT WORK?

- The product doesn't interfere with germination but rather stops the formation of new root cells in the seed. Without roots, the seedlings cannot continue to feed and grow and they just die back.
- This whole process happens at the soil level under the blades and thatch of the grass so you don't have to see the sprouted weeds.

HOW DO I GET THE FULL BENEFITS OF THE PRODUCT?

- Lawn needs to have been mowed recently as is more effective on a shorter leaf.
- Must be applied to dry turf only (slight moisture on the leaf is okay).
- Must be watered in well (at least 10mm of sprinkler irrigation), within 12 hours of application.
- Do not mow the treated area until the product has been watered in and turf foliage has dried.
- To extend the control period, a secondary application should be made 7-10 weeks after the first.

If you have any questions, please do not hesitate to ask. Thank you for choosing us.
