ABOUT THE PRODUCT

Noonan Fine Leaf Dwarf Kikuyu is a less aggressive kikuyu than most. The regrowth time is up to 3 times longer than other varieties of kikuyu, due to its thinner, slower growing runners. It also has a finer leaf structure which can be more appealing and softer than a thick leaf. Noonan Kikuyu requires a full sun position and is popular for high traffic areas as it is the hardest-wearing of all instant lawns, due to its ability to quickly self repair.

AFTERCARE

Establishing

- Soak for 10-14 days after installation, or until established

Mowing

- Regular weekly mowing is recommended, particularly during spring and summer
- Recommended cutting height is 25mm
- When mowing, only take 1/3 off the leaf at one time

Watering

- Once established, water weekly or as necessary, depending on weather
- Give 1-2 deep waters per week in the heat of summer, using the colour of the lawn as guidance
- Winter watering is still necessary as this lawn does not go completely dormant, but needed less often due to rainfall

Fertilising

- Fertilise 6-8 weeks after laying, then once each season for optimal results
- Granular fertiliser recommended
